AUDIENCEKIT · A PITCH

# The future of community *marketing.*

Communities that own their app. Advertising priced by context, not by surveillance. Revenue that pays for the place itself.

THE SHIFT

# Reach used to be rented. The next decade belongs to scenes that *own their place.*

Owned apps, private members, and attention sold by context: city, night and event. Never by a profile of the person looking.

WHAT BROKE

# The big platforms charge rent on reach.

01

## Surveillance ads

Members are profiled across every app they use, and targeting is blocked, regulated or distrusted.

02

## Algorithm rent

Organizers pay to reach people who already follow them, while organic reach keeps falling.

03

## Cross-app profiles

One breach or one policy change exposes everyone, and brands sit wherever the feed decides.

04

## Engagement farming

Feeds reward outrage over the next good night out. Attention is cheap, intent is rare.

THE MODEL

# Every community gets its own app.

Places, events and people in an app with the community's own name. The plumbing underneath is shared, so a new one is ready on day one.

### Its own identity

Its own name, domain, accent colour and spectrum. Members see the community, not us.

### Its own data

A separate tenant with its own members, keys and rules. No profile is built across audiences.

### Its own rules

It decides on ads, the AI host and what goes public. What's banter in one scene is a problem in another.

Shared tools for the people who run it: Focus, Velvet, Backstage and Arbiter on iPhone, iPad and Android, plus a GraphQL API and SDKs.

TENANT SEPARATION & DATA SOVEREIGNTY

# We host communities. We don’t collect people.

That is what makes them better places to market to: trusted, private, and built around what people came to do.

ADVERTISING A COMMUNITY CAN LIVE WITH

# Six rules every placement follows.

**01 · Flat price**

A slot is a city and a night, from a public rate card. No clicks, no auctions.

**02 · Context only**

City, date, night, venue and event tags. Never a viewer's history or identity.

**03 · Labelled, capped**

Always marked "Promoted". One or two per screen, rotated fairly.

**04 · One metric**

Distinct viewers per listing per week, closed weeks only, floored at "fewer than 20".

**05 · Money returns**

Ad revenue offsets the audience's hosting subscription.

**06 · Real opt-out**

An organization can sponsor members ad-free, or members can pay the hosting.

WHERE THE MONEY GOES

# Ads pay for the place, not for a profile.

**Advertiser**

### Books a city and a night

A venue, promoter, brand or publisher picks a slot at the published price.

**Community**

### Sees a labelled card

Shown by context in the Now, Venues or People feeds, rotated fairly.

**Hosting**

### Gets cheaper to run

Revenue is credited to the audience’s hosting, directly or through its setup provider.

We are our own first advertiser: AudienceKit and Love Wins Media run labelled house cards in every app under the same rules.

SEE IT LIVE

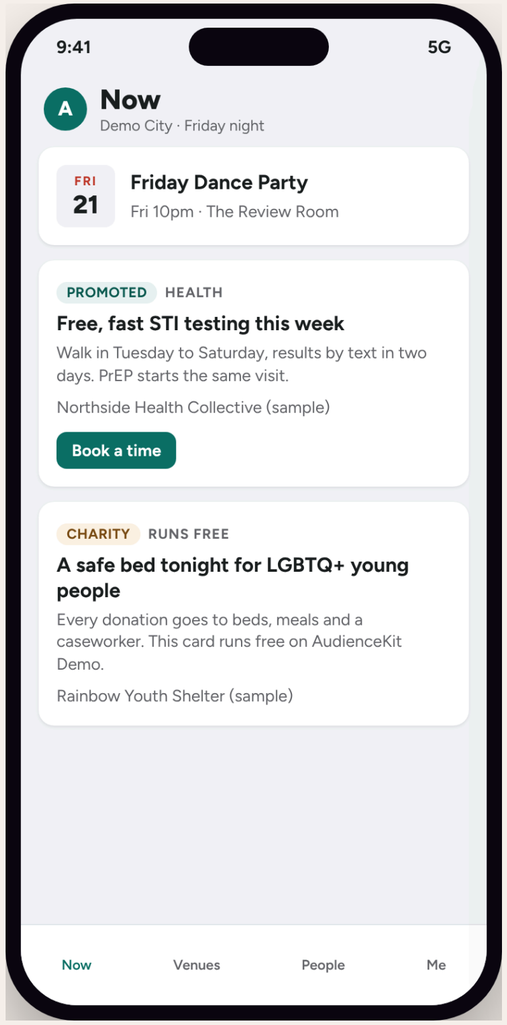

# Sample ads now run in AudienceKit Demo.

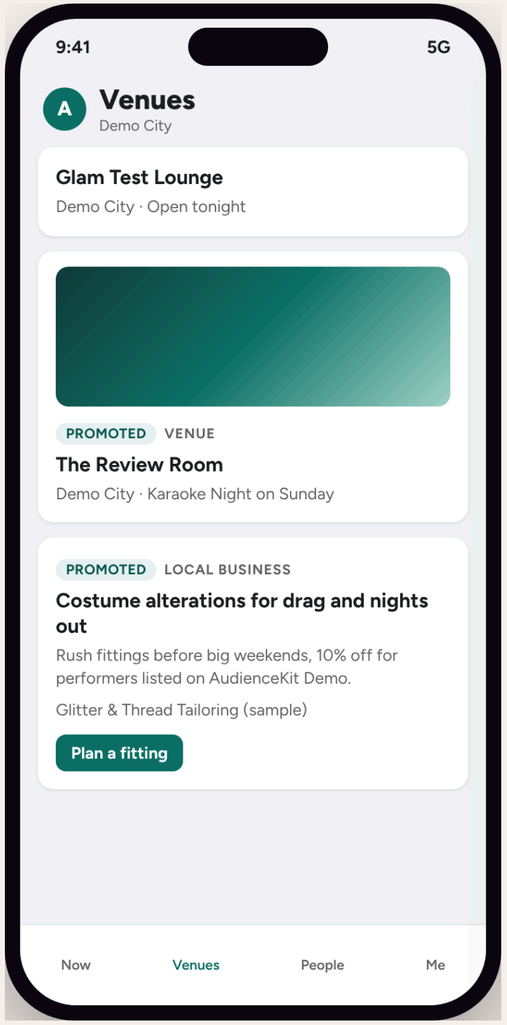

Nine cards booked into the demo audience show a prospect exactly what an audience open to sponsors looks like.

**Its own venues and events**, labelled Promoted like any paid booking.

**One sponsor per category**: a clinic, a café hiring, a tailor and two charities, each marked “(sample)”.

**The same rules as real ads**: context only, never first, at most two a screen.

THE AUDIENCE DECIDES

# Four advertising levels, set per audience.

### 1 · None

Zero ads and zero preferred placement. An organization or the members can pay for hosting instead.

### 2 · Sponsorship only

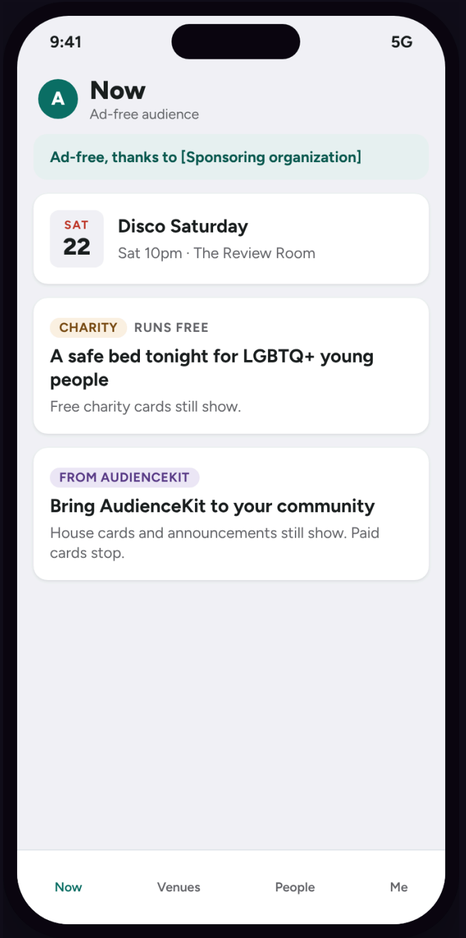

No ads, no tracking. Venues and events already in the app can sponsor premium placement, labelled Sponsored. Hot Mess runs this way.

### 3 · Privacy-protected ads

Contextual, flat-priced, labelled Promoted, never built on viewer data. See it in AudienceKit Demo.

### 4 · Traditional ads

The app brings its own ad networks and tracking through the SDK, and gives up the strong guarantees.

**Publisher ads are separate.** Soapbox publishers keep their own ad relationships, so they can keep paying writers and funding their work, and AudienceKit takes no cut, just as with performers. Readers acknowledge this when an app shows publisher content.

TRADITIONAL ADS: THE HYBRID MODEL

# Bring your own marketing with the SDK, and own the trade-off.

Any app can build on the AudienceKit SDK and add its own traditional marketing: ad networks, tracking pixels, analytics, email and retargeting lists.

**Hosted on AudienceKit**

### The strong guarantees hold

Contextual ads only, no viewer profiles, nothing shared across audiences, one weekly number for sponsors, and the audience decides.

**Hybrid app**

### The strong guarantees do not hold

Whatever the app adds runs outside our rules, so the app loses AudienceKit's strong trust and privacy guarantees.

**A bridge out of data addiction.** Start hybrid, keep the marketing you depend on today, and move it onto contextual placements one channel at a time, until the app no longer needs its members' data.

WHERE BRANDS MEET THE COMMUNITY

# Inside the moments people came for.

### Promoted cards

A venue, event or business in the Now, Venues and People feeds for a city and night.

**Live in the demo**

### Events & tickets

Listings from Facebook, Eventbrite and Ticketmaster, with RSVPs and ticket links.

**Live**

### Quickie

One opt-in at a venue sends an anonymous invite to others at the same venue.

**Live in Hot Mess**

### Soapbox publishers

Trusted local publishers post articles and push a locale about events and volunteering.

**Built**

### Event photos

Photographers share sets to the audiences they shoot for.

**Live**

### Venue tools

Velvet runs a venue's listing, lineups, chat and staff safety alerts.

**Velvet 1.10 next**

SOAPBOX: PUBLISHERS INSIDE THE APP

# Bring digital content in safely, and keep the curators.

The big platforms cut out the editors, critics and local papers who used to tell a scene what was on. Soapbox brings them back in, credited, paid and in front of their readers.

### Brought in safely

Only trusted publishers: each publication is pending, trusted or suspended, and the audience decides.

Pushes are for showing up, events and volunteering, never fundraising.

Before their first story, readers acknowledge that the publisher runs its own ads.

### Curators stay in business

Publishers keep their own ad relationships to pay writers. AudienceKit takes no cut, just as with performers.

Until a publisher onboards, stories link out to its own site, where its ads and traffic are.

Members can send op-eds, and readers will be able to tip to remove ads.

SAFETY

# Big-platform safety. Small-community control.

### Automation flags

Member reports, message checks and the audience's own word lists, around the clock.

### An AI host helps

Arbiter reads chat as it happens, nudges the small stuff and proposes the rest.

### People decide

Uncertain calls wait for a person. Every action is logged and can be undone.

| | Big AI | Arbiter |
|---|---|---|
| **Where it runs** | One company's cloud, for every app at once | The community's own Mac, with open models running locally |
| **What it sees** | Who you are and what you do everywhere | Letters (A, B, C) and the last few lines of the room. Never names, profiles or tribes |
| **Whose rules** | The platform's, the same everywhere | The audience's own rules, prompts and word lists |
| **Who has the last word** | The model, with appeals into a void | A person. It can't touch admins, and its bans lift in 24 hours unless an admin confirms |

VELVET SAFETY ALERTS

# One tap, and the staff on shift are on the way.

**1 · Tap**

A guest taps “I feel unsafe” in the app. It works only while they are at the venue, and even a venue ban doesn’t block it.

**2 · Staff hear it**

Every Velvet device on shift gets a loud alert at once. Shifts can follow the venue’s geofence, on when staff walk in and off when they leave.

**3 · “I’m on it”**

The first to pick it up is named to the guest: “Jo is on the way.” They talk in a private thread, with support lines and a ride home a tap away.

**4 · Never dropped**

If nobody picks it up in two minutes, the managers hear it, the guest is offered other help, and the audience’s team is flagged.

**Discreet by design.** Guest notifications never say “safety” or “unsafe” on a lock screen. Staff can run practice alerts, and alerts only flag, they never ban anyone.

PROOF

# Five audiences. One platform.

**Hot Mess**

## Queer nightlife, no ads, no tracking

No targeted ads, no tracking. Venues and events already in the app can sponsor premium placement, clearly disclosed.

Live on the App Store and Google Play in the US since October 19, 2026, with venue listings across the US, Canada, Mexico, the UK and Australia.

**Hack Different**

Android on Google Play, iOS in review. GitHub sign-in in development.

**DNC**

Prototype for local party engagement, sponsored ad-free.

**DANCE 89.5**

A radio station’s community.

**AudienceKit Demo**

Where prospects see a live ad placement.

YOU BRING THE PEOPLE

# Let’s make *your scene.*

**Organizers**

Your own app, console and safety tools.

**Venues & brands**

See a live placement in the demo audience, then book a night.

**Organizations**

A sponsored, ad-free app for your members.
